

I Claim:

1. A graft fixation device, comprising:

5 an implantation member, said implantation member having a longitudinal axis, a proximal end, a distal end, an outer surface, and a longitudinal passage therethrough;

10 at least one graft retention member, the retention member having a first section extending from the proximal end of the implantation member, and a second section angulated with respect to first section for engaging a graft.

2. The device of claim 1, wherein the implantation member has a series of ridges extending from the outer surface.

15 3. The device of claim 1, wherein the retention member comprises a rod member.

20 4. The device of claim 3, wherein the retention member has an oval cross-section.

25 5. The device of claim 1, additionally comprising a frustoconical insertion member extending from the distal end of the implantation member, said insertion member having a proximal end, a distal end and an axial passage therethrough.

6. The device of claim 1, wherein the implantation member has a cylindrical configuration.

30 7. The device of claim 5 wherein the insertion member comprises a bioabsorbable material selected from the group consisting of polylactic acid,
